# 1 Module splacris

## 1.1 Variables

Name	Description
<code>--package--</code>	<b>Value:</b> None

## 1.2 Class Cost

This class loads the cost table to a Python hash table the hash is <feature><trace list> i.e. "F["K","L","U"]":5.5

### 1.2.1 Methods

<b><code>--init--(self, cost_file)</code></b>
Constructor method for Cost class , This method instance a cost object
<b>Parameters</b>
<b>self:</b> the cost table instance ( <i>type=Cost instance</i> )
<b>cost_file:</b> Cost table file ( <i>type=string</i> )
<b>Return Value</b>
A Cost object ( <i>type=Cost object</i> )

<b><code>get_cost(self, trace, feature)</code></b>
Function to get the cost of compute a feature given the previously computed features
<b>Parameters</b>
<b>self:</b> the current Cost instance ( <i>type=Cost instance</i> )
<b>trace:</b> The features trace ( <i>type=list</i> )
<b>feature:</b> The produced feature ( <i>type=string</i> )
<b>Return Value</b>
The cost of compute the feature ( <i>type=float</i> )

### 1.3 Class *SPLAcris*

This class defines the *SPLAcris* cost function. In this case a *SPLAcris* object will represent a state in the FSM.

#### 1.3.1 Methods

<b><code>__init__(self, term, trace, cost, itime, etime, uthreshold, lthreshold)</code></b>	
Constructor method for <i>SPLAcris</i> class , This method instance a <i>SPLAcris</i> object	
<b>Parameters</b>	
<b>self:</b>	the current <i>SPLAcris</i> instance ( <i>type=SPLAcris instance</i> )
<b>term:</b>	Current <i>SPLAcris</i> term ( <i>type=etree SPLAcris term</i> )
<b>trace:</b>	Computed trace to generate current term ( <i>type=string</i> )
<b>cost:</b>	Cost to generate current trace ( <i>type=integer</i> )
<b>itime:</b>	Initial time ( <i>type=time</i> )
<b>etime:</b>	End time ( <i>type=time</i> )
<b>uthreshold:</b>	Upper threshold ( <i>type=float</i> )
<b>lthreshold:</b>	Lower threshold ( <i>type=float</i> )
<b>Return Value</b>	
	A <i>SPLAcris</i> object ( <i>type=SPLAcris object</i> )

  

<b><code>check_syntax(self)</code></b>	
Function to check the term syntax	
<b>Parameters</b>	
<b>self:</b>	the current <i>SPLAcris</i> instance ( <i>type=SPLAcris instance</i> )
<b>Return Value</b>	
	1 if is good 0 if bad ( <i>type=integer</i> )

---

**check\_constraints**(*self*, *tree\_original*, *feature*)

---

Function to check if a constraint can be computed this method returns a tree with the constraint computed

**Parameters**

**self:** the current *SPLAcris* instance  
*(type=SPLAcris instance)*

**tree\_original:** The actual *SPLA* term  
*(type=etree)*

**feature:** The produced feature (to check the constraint)  
*(type=string)*

**Return Value**

The new tree with the constraint computed if applies  
*(type=etree SPLAcris term)*

---

**is\_forb**(*self*, *tree*, *feature*)

---

Function to check if a feature is forbidden this method returns 1 if the feature is forbidden, 0 otherwise

**Parameters**

**self:** the current *SPLAcris* instance  
*(type=SPLAcris instance)*

**tree:** The actual *SPLA* term  
*(type=etree)*

**feature:** The produced feature  
*(type=string)*

**Return Value**

1 if is forbidden 0 otherwise  
*(type=integer)*

---

**is\_mand**(*self*, *tree*, *feature*)

---

Function to check if a feature is mandatory this method returns 1 if the feature is mandatory, 0 otherwise

**Parameters**

**self:** the current SPLAcris instance  
*(type=SPLAcris instance)*

**tree:** The actual SPLA term  
*(type=etree)*

**feature:** The produced feature  
*(type=string)*

**Return Value**

1 if is forbidden 0 otherwise  
*(type=integer)*

---

**is\_optional**(*self*, *tree*, *feature*)

---

Function to check if a feature is optional

**Parameters**

**self:** the current SPLAcris instance  
*(type=SPLAcris instance)*

**tree:** The actual SPLA term  
*(type=etree)*

**feature:** searched feature  
*(type=string)*

**Return Value**

1 if optional 0 otherwise  
*(type=integer)*

---

**is\_feature\_inside**(*self*, *tree*, *feature*)

---

Function to check if a feature is inside the term

**Parameters**

**self:** the current SPLAcris instance  
*(type=SPLAcris instance)*

**tree:** The actual SPLA term  
*(type=etree)*

**feature:** searched feature  
*(type=string)*

**Return Value**

1 if is found 0 otherwise  
*(type=integer)*

---

**has\_nil**(*self*, *tree*)

---

Function to check if the term has nil inside
**Parameters**

**self:** the current SPLAcris instance  
*(type=SPLAcris instance)*

**tree:** The actual SPLA term  
*(type=tree)*

**Return Value**

1 if a nil is found, 0 otherwise  
*(type=integer)*

---

**is\_computable**(*self*, *tree*, *feature*)

---

Function to check if a feature is computable
**Parameters**

**self:** the current SPLAcris instance  
*(type=SPLAcris instance)*

**tree:** The actual SPLA term  
*(type=etree)*

**feature:** searched feature  
*(type=string)*

**Return Value**

0 if is not computable 1 otherwise  
*(type=integer)*

---

**is\_computed**(*self*, *trace*, *feature*)

---

Function to check if a feature was computed
**Parameters**

**self:** the current SPLAcris instance  
*(type=SPLAcris instance)*

**trace:** Computed features  
*(type=list)*

**feature:** searched feature  
*(type=string)*

**Return Value**

0 if was not computed 1 if yes  
*(type=integer)*

**has\_mand**(*self*, *tree*)

Function to check if a term has mand features this method returns 1 if has mand features, 0 otherwise

**Parameters**

**self**: the current SPLAcris instance  
(*type=SPLAcris instance*)  
**tree**: The actual SPLA term  
(*type=etree*)

**Return Value**

1 if is has mand features 0 otherwise  
(*type=integer*)

**get\_mand**(*self*, *tree*)

Function to get the mand features list this method returns a list of mand features

**Parameters**

**self**: the current SPLAcris instance  
(*type=SPLAcris instance*)  
**tree**: The actual SPLA term  
(*type=etree*)

**Return Value**

a list with mand features  
(*type=list*)

**get\_forb**(*self*, *tree*)

Function to get the forb features list this method returns a list of forb features

**Parameters**

**self**: the current SPLAcris instance  
(*type=SPLAcris instance*)  
**tree**: The actual SPLA term  
(*type=etree*)

**Return Value**

a list with forb features  
(*type=list*)

**is\_blocked**(*self*, *tree*)

**get\_computables**(*self*, *tree*)

Function to get the computables list

**Parameters**

**self**: the current *SPLAcris* instance  
*(type=SPLAcris instance)*

**tree**: The actual *SPLA* term  
*(type=etree)*

**Return Value**

list with computables features  
*(type=list)*

**merge\_parallels**(*self*)

Function to merge consecutive parallels in order to be able to process the term

**Parameters**

**self**: the current *SPLAcris* instance  
*(type=SPLAcris instance)*

**Return Value**

1 if parallels were merge, 0 otherwise  
*(type=boolean)*

**merge\_choose\_1**(*self*)

Function to merge consecutive choose.1 in order to be able to process the term

**Parameters**

**self**: the current *SPLAcris* instance  
*(type=SPLAcris instance)*

**Return Value**

1 if choose.1 were merge, 0 otherwise  
*(type=boolean)*

---

**remove\_choose\_1**(*self*, *tree\_original*, *feature*)
 

---

Function to remove features inside the choose\_1 operator and leave the feature to be computed with the choose\_1

**Parameters**

**self:** the current SPLAcris instance  
*(type=SPLAcris instance)*

**tree\_original:** The source tree  
*(type=etree SPLAcris term)*

**feature:** The feature which indicates which choose\_1 must be removed  
*(type=string)*

**Return Value**

An etree object without the choose\_1 operator  
*(type=etree SPLAcris term)*

---

**remove\_lonely\_choose\_1**(*self*, *tree\_original*)
 

---

Function to remove lonely choose\_1 relationships

**Parameters**

**self:** the current SPLAcris instance  
*(type=SPLAcris instance)*

**tree\_original:** The actual SPLA term  
*(type=etree)*

**Return Value**

tree without lonely choose\_1 relationships  
*(type=etree)*

---

**remove\_feature**(*self*, *tree\_original*, *feature*)
 

---

Function to produce a feature, receives a term and a feature to be extracted and returns the term without the feature

**Parameters**

**self:** the current SPLAcris instance  
*(type=SPLAcris instance)*

**tree\_original:** The source tree  
*(type=etree SPLAcris term)*

**feature:** The feature to be removed  
*(type=string)*

**Return Value**

An etree object without the feature  
*(type=etree SPLAcris term)*

---

**can\_tick**(*self*, *term*)

---

Function to check if a term can tick It will check for: TICK - OFEAT2 - CON3 - REQ3 - EXCL4 - FORB2 - MAND1

**Parameters**

**self:** the current *SPLAcris* instance  
*(type=SPLAcris instance)*

**term:** The actual *SPLA* term  
*(type=etree)*

**Return Value**

1 if can tick 0 otherwise  
*(type=integer)*

---

**compute\_feature**(*self*, *tree\_original*, *feature*, *cost\_table*)

---

Function to compute a feature, receives a *SPLAcris* instance, a feature to be computed and a cost table

**Parameters**

**self:** the current *SPLAcris* instance  
*(type=SPLAcris instance)*

**tree\_original:** The source tree  
*(type=etree SPLAcris term)*

**feature:** The feature to be removed  
*(type=string)*

**cost\_table:** The cost table  
*(type=A cost function object)*

**Return Value**

A *SPLAcris* object  
*(type=SPLAcris)*
